## Verdens største digitalkamera skal fotografere milliarder af galakser

15. september 2015 kl. 13:51  0 kommentarer

I løbet af 10 år skal himmelrummet over den sydlige halvkugle affotograferes ved hjælp af et 3,2 gigapixel kamera i et nyt, stort teleskop, der skal stå klar i 2022. Astronomerne kan næsten ikke vente.

Universet skal kortlægges, og det kræver et nyt, stort teleskop med et kamera ud over det sædvanlige.

Sådan et kan forskerne på SLAC National Accelerator Laboratory i USA nu begynde at bygge, efter at de amerikanske myndigheder har [vendt tommelfingeren opad](#) for projektet.

# Supernovae and transients

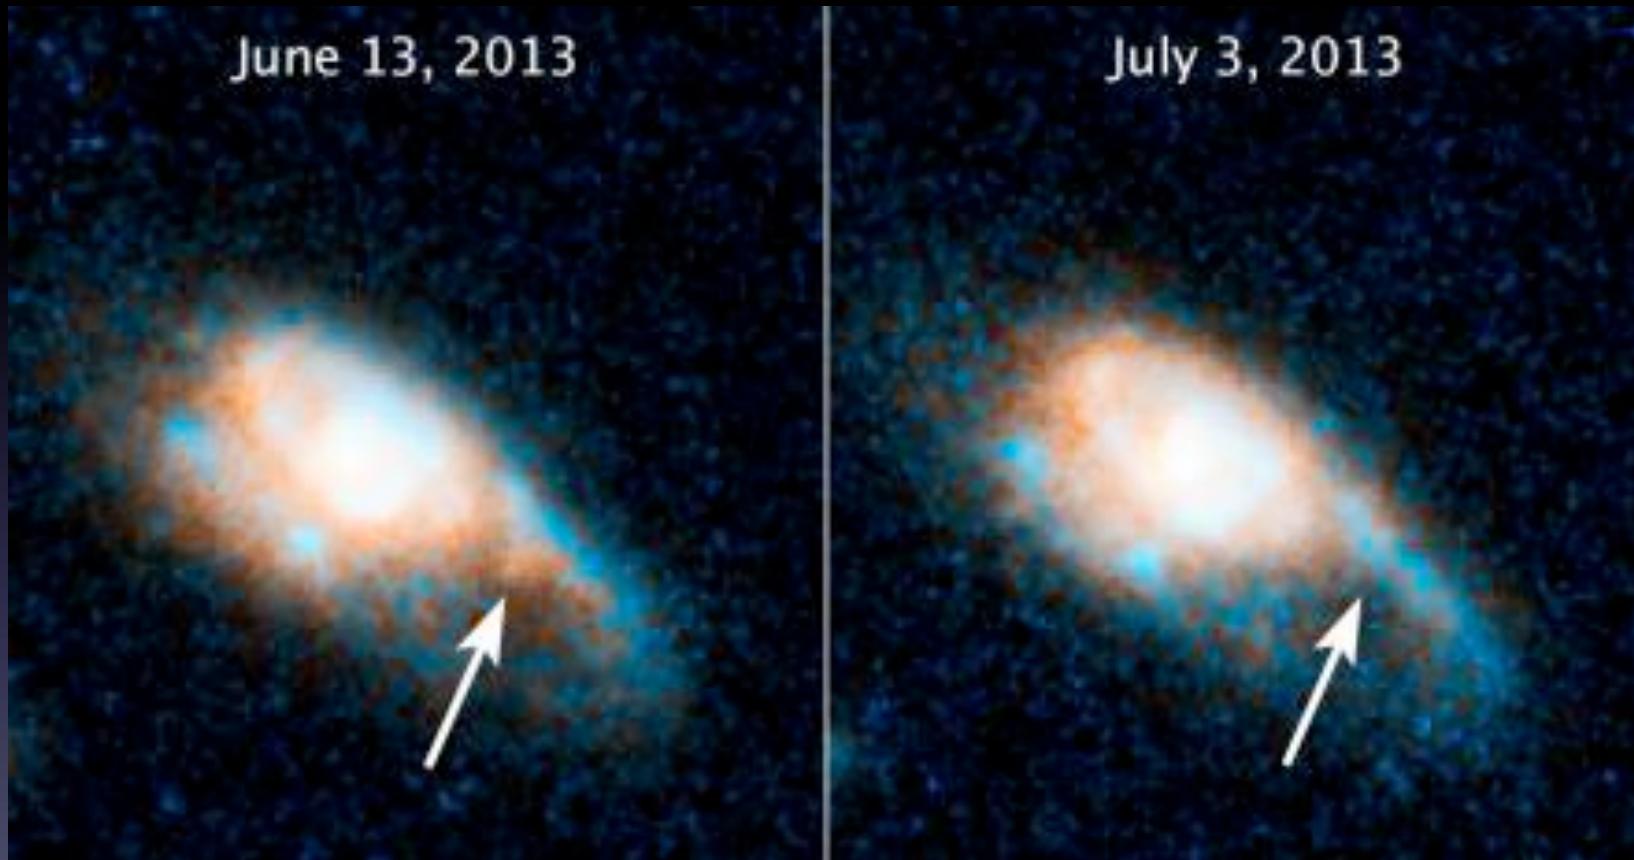

Explosive formation of elements, molecules, dust

New types of transients (X-shooter/NTE/SOXS/JWST/EUCLID...)

Lensed supernovae, superluminous supernovae, standard candles

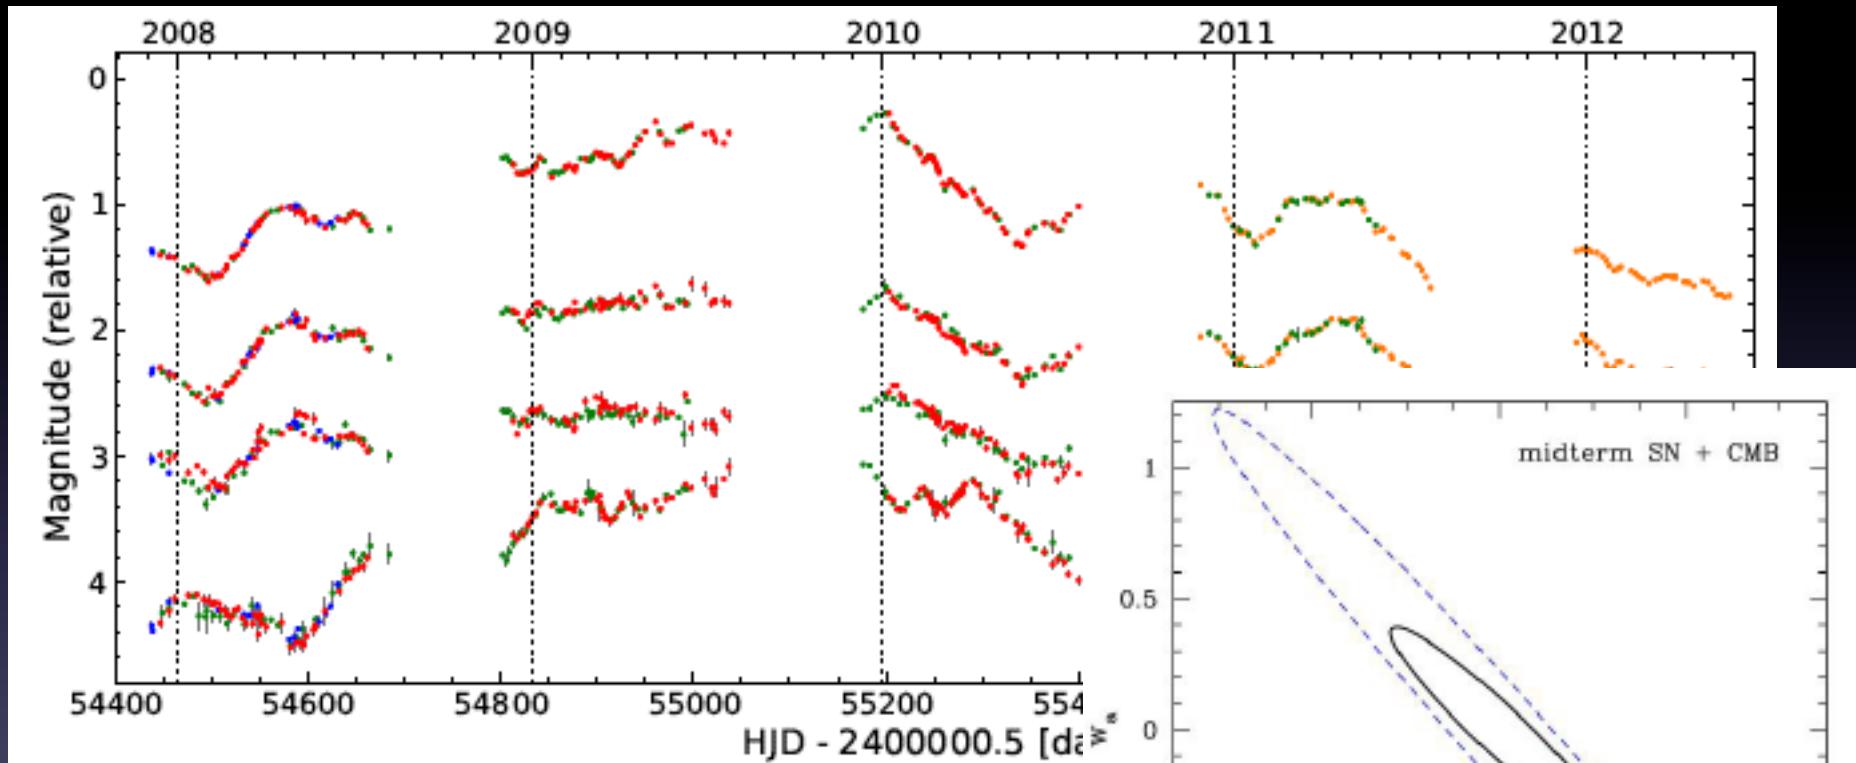

Theory of transients

# Gravitational wave counterparts

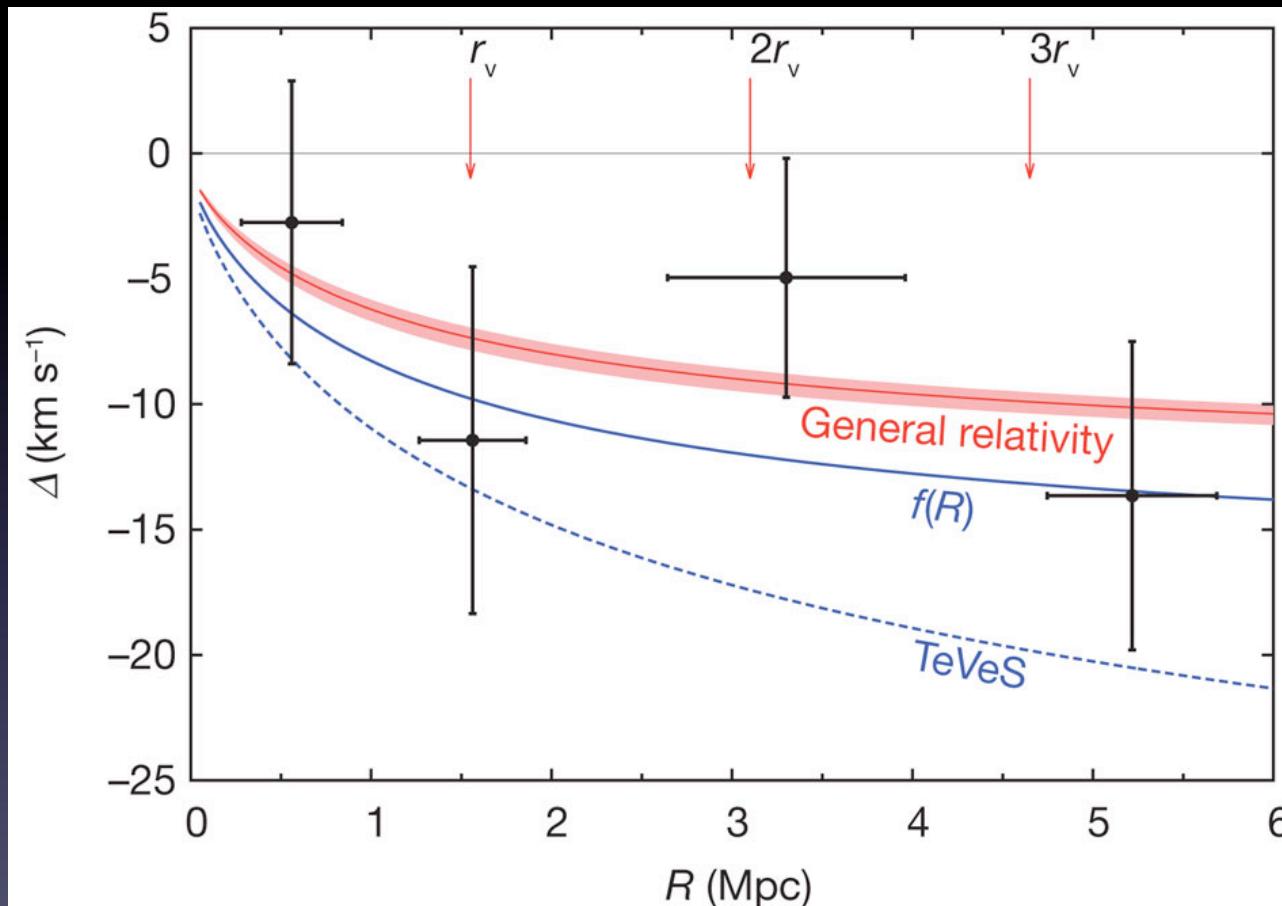

Short gamma-ray bursts = merging neutron stars = r-process **kilonovae**  
Detection with LSST/A-LIGO/*Swift*/*SVOM*  
Follow up with X-shooter/NTE/SOXS/*JWST*

# Time delay science

Hundreds of accurate time delays  
QSOs and supernovae  
Competitive constraints on dark energy  
*JWST/E-ELT*

# Gravitational redshifts in clusters

Millions of accurate photometric redshifts of galaxies in clusters  
Constraints on dark matter + alternative theories of gravity

# *EUCLID* synergy

Denmark one of few partners who are/will be full partners of both LSST and *EUCLID*

*EUCLID*: Near-infrared

Photometric redshifts

Dark energy
