

QUANTUM OPTICS SEMINAR

Title: Numerical Solution of the Time-Dependent Schrödinger Equation using the FEDVR/RSP2 Method

Speaker: Dr Barry I. Schneider, Physics Division, National Science Foundation, Arlington, VA

Time: Tuesday, October 4, 2005 at 14:15

Place: 520-616

Abstract:

A solution of the time-dependent Schrödinger equation (TDSE) is required in a variety of problems in physics and chemistry. These include atoms and molecules in time dependent electromagnetic fields, time-dependent approaches to atomic collision problems and in describing the behavior of materials subjected to internal and external forces. We present a new approach in which the Finite Element Discrete Variable Representation (FEDVR) is combined with the Real-Space Product (RSP) algorithm to generate an efficient and highly accurate method for the solution of the time-dependent linear/nonlinear Schrödinger equation. The FEDVR provides a highly-accurate spatial representation (FEDVR) using a minimum number of grid points (N) while the RSP algorithm propagates the wavefunction in $O(N)$ operations per time step. Parallelization of the method is transparent and is implemented by distributing one spatial dimension across the available processors, within the Message-Passing-Interface (MPI) scheme. The complete formalism and a number of three-dimensional (3D) examples will be given to demonstrate its high accuracy and efficacy.
